AlphaLISA® SureFire® Ultra™

Assay Principle

The AlphaLISA® SureFire® Ultra™ assay kits allow the rapid, sensitive, and quantitative detection of phosphoproteins from cells. The kits utilize Alpha beads that are each coated to specifically capture one of the assay antibodies. The Donor bead is coated with streptavidin to capture the biotinylated antibody. The Acceptor bead is coated with a proprietary CaptSure™ agent that immobilizes the other assay antibody which is labeled with a CaptSure™ tag. As such, this assay system performs well in the presence of extraneous antibodies, such as antibody biotherapeutics, and can be used to screen such reagents. In the presence of phosphorylated protein, the two antibodies bring the Donor and Acceptor beads close to each other, enabling the generation of an Alpha signal upon illumination of Donor beads by the Alpha-enabled plate reader, such as the EnVision® Multilabel Plate Reader or Enspire® and EnSight™ Multimode Plate Readers. The amount of light emission is directly proportional to the amount of phosphoprotein present in the sample.

The AlphaLISA® SureFire® Ultra™ assay kits are also optimized for enhanced signal-to-noise windows, while using shorter incubation times and larger volumes for pipetting compared to the AlphaScreen® SureFire® kits. This assay eliminates the need for laborious techniques, such as Western blotting or conventional ELISA. It is a homogeneous assay, in that no sample washing steps are required, which allows for minimal handling, short assay times, better well-to-well reproducibility (lower CV%), and robotic operation if desired. The assay utilizes the bead-based Alpha Technology, and requires an Alpha Technology-compatible plate reader.
General Information on the AlphaLISA® SureFire® Ultra™ ERK 1/2 Total assay

The AlphaLISA® SureFire® Ultra™ ERK 1/2 Total assay is used to measure total ERK 1/2 levels in cellular lysates. The assay is an ideal system for normalizing ERK 1/2 levels for experiments measuring changes in ERK 1/2 phosphorylation in cellular lysates, and can be applied to primary cells.

This kit has been formulated to provide improved signal:noise assay windows, and to perform without interference in the presence of extraneous antibodies.

Kit-Specificity information

This assay kit contains 2 antibodies which recognize two distinct epitopes on ERK1 and ERK2. The proteins detected by this kit correspond to GenBank Accessions NP 002737 (ERK1) and NP 620407 (ERK2). Alternate Names include p44 MAPK, MAPK3 (ERK1), p42 MAPK, MAPK1 (ERK2).

These antibodies recognize ERK 1/2 of human, mouse and rat origin. Other species should be tested on a case-by-case basis.

Storage Conditions Upon Receipt
The kit should be placed at 4°C upon receipt. DO NOT freeze the kit buffers or beads – the Reaction buffer contains antibodies and freeze/thaw cycles can lead to a loss of activity.

AlphaScreen Donor Beads need to be stored at 4°C in the dark, and should be returned to the kit box after use.

The Activation Buffer precipitates at 4°C. To re-dissolve, warm to 37°C and mix before each use. Alternatively, Activation buffer can be stored at room temperature with no loss in activity. All other components to be returned to 4°C after each use.

The Positive control lysate tube should be placed at -20°C or -80°C for long term storage.

This product is stable for at least 9 months from the manufacturing date if used and stored under recommended conditions.

(1) Plates used for the immunoassay; (2) Same as (1) but optimal if cross-talk needs to be reduced; (3) plates for assays run in a 1-plate protocol (from cell seeding to immunoassay); (4) plates used to seed and stimulate cells before Lysis and transfer of lysate in an immunoassay plate.

For more assay plates options, please go to [www.perkinelmer.com/microplates](http://www.perkinelmer.com/microplates)

Precautions
*Only the AlphaScreen® Donor beads are light-sensitive. All the other assay reagents can be used under normal light conditions. All Alpha assays using the Donor beads should be performed under subdued laboratory lighting (< 100 lux). Green filters (LEE 090 filters (preferred) or Roscolux filters #389 from Rosco, or the equivalent) can be applied to light fixtures.

AlphaLISA® SureFire® Ultra™ ERK 1/2 Total Assay Protocols

A. 2-Plate Assay - assay protocol for adherent cells

Cell Seeding
1. Seed cells (200 µL of cells for 96 well plates, 50 µL for 384 well plates) in tissue culture plates. Incubate at 37°C overnight in serum-containing media.

Cell Treatment
2. Remove culture media, and stimulate the cells with 50 µL agonists prepared in serum-free media (25 µL for 384-well plates). (If testing antagonists, prior to stimulation remove culture medium and replace with 50 µL serum-free media containing antagonists (25 µL for 384-well plates)). Return cells to 37°C incubator for desired time. 1 hour is often sufficient for signal transduction inhibitors, and 5-20 minutes for receptor agonists.

Note: Peptidic agonists and antagonists can often stick to plastic surfaces. To minimize this effect, dilute in serum-free media containing a suitable carrier protein (e.g. 0.1% BSA)

Lysate Preparation
3. To lyse cells, remove medium from wells, and add freshly prepared 1X Lysis Buffer (50-100 µL for a 96 well plate, 25 µL for a 384 well plate). Agitate on a plate shaker (~350 rpm) for 10 minutes at room temperature.

4. Take 10 µL of the lysate and transfer to a 384-well Optiplate™ for assay. (Add 10 µL Control lysates to separate wells if required).

SureFire Ultra Assay
5. Add 5 µL of Acceptor Mix to wells. Seal plate with Topseal-A adhesive film, and cover plate with foil. Incubate for 1 hour at room temperature.

6. Add 5 µL of Donor Mix to wells under subdued light. Seal plate with Topseal-A adhesive film, and cover plate with foil. Incubate for 1 hour at room temperature in the dark.

Note: Longer incubation may give greater sensitivity. Plates can be incubated overnight if required.

7. Read plate on an Alpha Technology-compatible plate reader, using standard AlphaLISA settings.
AlphaLISA® SureFire® Ultra™: 2-plates / 2-incubation assay flowchart

### Adherent Cells

- Seed cells in 96 / 384 well plate, in 200 μl / 50 μl culture medium
- 6 h to Overnight (≥16h) adherence
- (4h to O/N Serum Starvation)\(^2\)
- Remove medium
- Add inhibitor in 45 μl / 22.5 μl new medium and incubate 5 min to 1 hour\(^2\)
- Add 5 μl / 2.5 μl of 10x-concentrated stimulator and incubate for desired time\(^4\)
- Remove medium (wash with PBS if using medium containing high biotin concentration, like RPMI)
- Add 50 to 100 μl / 20 to 25 μl of 1x Lysis Buffer and incubate for 10 min on plate shaker (~350 rpm).\(^3\)

### Suspension Cells

- Seed cells in 96 / 384 well plate, in 40 μl / 10 μl HBSS
- (2 h equilibration at 37°C)
- Add 20 μl / 5 μl of 4x-concentrated inhibitor and incubate 5 min to 1 hour\(^2\)
- Add 20 μl / 5 μl of 4x-concentrated stimulator and incubate for desired time\(^4\)
- Add 20 μl / 5 μl of 5x Lysis Buffer and incubate for 10 min on plate shaker (~350 rpm).\(^3\)

- Transfer 10 μl of lysate (or diluted positive control lysate, or Lysis buffer alone) to a white 384-well Plate
- Add 5 μL Acceptor Mix
- Seal, wrap in foil, and shake 1-2 minutes on plate shaker, Then incubate ≥1 h (RT* or 22°C)
- Add 5 μl of Donor Mix
- Seal, wrap in foil, and shake 1-2 minutes on plate shaker, then incubate ≥1 h, up to overnight (RT* or 22°C) Allow to equilibrate to plate reader temperature prior to reading.
- Read Plate

---

\(^1\) Depending on cell type and pathway analyzed.

\(^2\) Depending on type of inhibitor used: 5 min is generally enough for receptor antagonists; more time is needed to block intracellular targets.

\(^3\) May stop and freeze lysates at -20°C if desired. If doing this, re-shake after thawing to ensure homogeneity of lysate before pipetting.
**AlphaLISA® SureFire® Ultra™ ERK 1/2 Total**

**B. 1 Plate Assay** - assay protocol for non-adherent cells, and for high-throughput applications.

**Cell Seeding**
1. Harvest cells by centrifugation, and re-suspend cells in HBSS at a suitable cell density. We recommend $10^7$ cells/mL as a starting point. Seed 4 μL of cells/well into a 384-well white opaque culture plate (e.g. PerkinElmer Cat # 6007680).

2. If using test agents/inhibitors, add 2 μL/well of 4X inhibitors prepared in HBSS.

**Note:** Peptidic agonists and antagonists can often stick to plastic surfaces. To minimize this effect, dilute in HBSS containing a suitable carrier protein (e.g. 0.1% IgG free BSA - Jackson ImmunoResearch Cat #001-000-161).

3. Return cells to incubator at 37°C for 1-2 hours.

**Cell Treatment**
4. Stimulate cells with agonists by addition of 2 μL/well of 4X agonist stock in HBSS containing 0.1% BSA. The final volume in the wells should be 8 μL. (*if no antagonists were used in step 2, stimulate the cells with 4 μL/well of 2X agonist, to give a final volume in the wells of 8 μL.)*

**Lysate Preparation**
5. To lyse the cells, add 2 μL/well of 5X Lysis Buffer. *(Add 10 μL control lysates to separate wells if required)*

**SureFire Ultra Assay**
6. Add 5 μL of Acceptor Mix to wells. Seal plate with Topseal-A adhesive film, and cover plate with foil. Incubate for 1 hour at room temperature.

7. Add 5 μL of Donor Mix to wells under subdued light. Seal plate with Topseal-A adhesive film, and cover plate with foil. Incubate for 1 hour at room temperature.

**Note:** Longer incubation may give greater sensitivity. Plates can be incubated overnight if required.

8. Read plate on an Alpha Technology-compatible plate reader, using standard AlphaLISA settings.
**AlphaLISA® SureFire® Ultra™: 1-plate / 2-incubation assay flowchart**

### Adherent Cells

- Seed cells in 384 well plate, in 20 μl culture medium
- Overnight (≥ 16h) adherence
- (4h to overnight Serum Starvation)\(^1\)
- Remove 10 μl of medium
- Add 5 μl of 3x-concentrated inhibitor and incubate 5 min to 1 hour\(^2\)
- Add 5 μl of 4x-concentrated stimulator and incubate for desired time
- Remove medium and add 10 μl of 1x Lysis Buffer
- Seal and incubate for 10 min on plate shaker (≈350 rpm).\(^3\)

#### Acceptors
- **Acceptors:**
  - Reaction Buffer 1: 141 μl
  - Reaction Buffer 2: 141 μl
  - Activation Buffer: 12 μl
  - Accetor Beads: 6 μl

### Suspension Cells

- Seed cells in 384 well plate, in 4 μl HBSS
- (2 h equilibration at 37°C)
- Add 2 μl of 3x-concentrated inhibitor and incubate 5 min to 1 hour\(^2\)
- Add 2 μl of 4x-concentrated stimulator and incubate for desired time
- Add 2 μl of 5x Lysis Buffer

#### Donors
- **Donors:**
  - Dilution Buffer: 294 μl
  - Donor Beads: 6 μl

---

1. Depending on cell type and pathway analyzed.
2. Depending on type of inhibitor used: 5 min is generally enough for receptor antagonists; more time is needed to block intracellular targets.
3. May stop and freeze lysates at -20°C if desired. If doing this, re-shake after thawing to ensure homogeneity of lysate before pipetting.

Control Lysate Information
Positive Control Lysate: Prepared from A431 cells, cultured to confluence in T175 flasks in 10% FBS containing medium for 3 days, then treated with EGF (200ng/mL) for 10min and lysed in 20mL of 1X SureFire Ultra Lysis buffer.

Representative Data

Data obtained with 2-incubation protocol.

Supplementary Buffers and Beads
If using the standard protocol, sufficient amounts of buffers and beads are provided in the kit. However in case the standard protocol would be modified, more buffers or beads may be needed. In this case, you can order additional buffers and beads using the following catalog numbers:

Note:

This assay can also be carried out as a single 2 hour incubation after separate additions of Acceptor Mix then Donor Mix, as indicated below in the flow chart. This can be applied to either 1-plate or 2-plate assays. Shown below is the 2-plate protocol in this format. This assay format may result in a slightly reduced sensitivity.

**AlphaLISA® SureFire® Ultra™: 2-plates / 1-incubation assay flowchart**

**Adherent Cells**
- Seed cells in 96 / 384 well plate, in 200 µl / 50 µl culture medium
  - 6 h to Overnight (≥ 16h) adherence
  - (4h to O/N Serum Starvation)¹
  - Remove medium
  - Add inhibitor in 45 µl / 22.5 µl new medium and incubate 5 min to 1 hour²
  - Add 5 µl / 2.5 µl of 10x-concentrated stimulator and incubate for desired time³
  - Remove medium (wash with PBS if using medium containing high biotin concentration, like RPMI)
  - Add 50 to 100 µl / 20 to 25 µl of 1x Lysis Buffer and incubate for 10 min on plate shaker (≈350 rpm).³

**Suspension Cells**
- Seed cells in 96 / 384 well plate, in 40 µl / 10 µl HBSS
  - (2 h equilibration at 37°C)
  - Add 20 µl / 5 µl of 4x-concentrated inhibitor and incubate 5 min to 1 hour²
  - Add 20 µl / 5 µl of 4x-concentrated stimulator and incubate for desired time³
  - Add 20 µl / 5 µl of 5x Lysis Buffer and incubate for 10 min on plate shaker (≈350 rpm).³

Transfer 10 µl of lysate (or diluted positive control lysate, or Lysis buffer alone) to a white 384-well plate

**Acceptor Mix:**
- Reaction Buffer 1: 141 µl
- Reaction Buffer 2: 141 µl
- Activation Buffer: 12 µl
- Acceptor Beads: 6 µl

**My volumes**

**Donor Mix:**
- Dilution Buffer: 294 µl
- Donor Beads: 6 µl

Add 5 µl of Acceptor Mix

Add 5 µl Donor Mix ⁴

Seal, wrap in foil, and shake 1-2 minutes on plate shaker, then incubate ≥2 h, up to overnight (RT or 22°C)
Allow to equilibrate to plate reader temperature prior to reading

Read Plate

¹ Depending on cell type and pathway analyzed.
² Depending on type of inhibitor used: 5 min is generally enough for receptor antagonists; more time is needed to block intracellular targets.
³ May stop and freeze lysates at -20°C if desired. If doing this, re-shake after thawing to ensure homogeneity of lysate before pipetting.
⁴ We recommend adding Acceptor Mix and Donor Mix in 2 sequential steps to maximize assay performance.
